TITLE: Dissociation of positive hydrogen ions in collisions with atoms and gas molecules

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 4, 1964, 1208-1211

TOPIC TAGS: proton cross section, hydrogen, nitrogen, helium, argon, particle collision, ionization phenomena

ABSTRACT: The purpose of the work was to repeat the measurements of the cross section for the production of protons following dissociation of molecular ions H_2^+ with energy 10--180 keV in hydrogen, nitrogen, helium, and argon, using the same setup as previously (ZhETF v. 36, 385, 1959), but with a more thorough elimination of the main sources of the systematic errors. Comparison of the data obtained

Card 1/3

ACCESSION NR: AP4031139

on these cross sections with the work published by others shows that over a wide energy range the majority of the curves obtained in recent work lies between the data of Sweetman (Proc. Roy. Soc. v. A256, 416, 1960 and private communication) and the early work by the authors, with the exception of the early data by C. F. Barnett (Second UN Intern. Conf. on Peaceful Uses of Atomic Energy, Geneva, 1958, Report 1789) which lie considerably below. Taken together, the various data cover almost the whole range of kiloelectron volt energies. For hydrogen, the maxima discovered and reported in the early work are confirmed, the first being due to the predominant contribution of the dissociation of H_2^+ ions into atoms and protons, and the second being related to the dissociation into two protons. A separate measurement of these two cross sections by J. Guidino (C. R. Paris, v. 253, 829, 1961) confirms these results. Orig. art. has: 4 figures and 1 formula.

TITLE: Ionization and scattering with characteristic energy losses in atomic collisions

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniye, v. 2, no. 6, 1965, 291-296

TOPIC TAGS: atomic physics, ionization, collision cross section, argon, krypton, neon

ABSTRACT: This is a continuation of an earlier investigation (ZhTF v. 34, 1613, 1624, and 1637, 1964) of the elementary acts of collisions between ions and argon atoms having kev energies at impact parameters smaller than the atomic dimensions, where it was found that the spectrum of the excess inelastic loss is not continuous, but consists of relatively narrow discrete lines, the energies of which do not depend on the shortest distance between the nuclei, on the relative velocity of the particles, or on the scheme of the elementary process by which the charge states are changed. To determine the extent to which the observed phenomenon is general, the authors investigated collisions between ions and atoms of different noble gases. The measured excess inelastic energy loss R^* for the $Ne^+ + Ar$ pair was found not to de-

Card 1/3

2

L 9298-66

ACC NR: AP5026412

pend on the scheme of the elementary process. Excitation of several R^* lines was observed in the investigated interval of shortest distances between the nuclei of the colliding particles. The regions in which one R^* line is excited, and the region where the transition occurs from excitation of one line to excitation of another, do not shift when the relative particle velocity changes. However, excitation of lines with different energies were observed when the velocities were different. Analogous results were obtained for $Kr^+ + Kr$ pair at 25 and 50 kev. In this case, three characteristic R^* lines were observed in the interval 100--600 ev. For the $Ne^+ + Ne$ pair at 50 kev, one R^* line with energy ~160 ev was observed. The authors investigated the connection between the excitation of the characteristic lines and the charges of the colliding particles. When like particles collide ("symmetrical" pairs $Ar^+ + Ar$, $Kr^+ + Kr$) this connection is manifest in a clear-cut correlation between the average charge of the scattered particles and the inelastic energy loss. No such correlation is observed when an "asymmetrical" pair is investigated ($Ne^+ + Ar$, energy 25 kev). The scattering of the colliding particles was also investigated in detail. It was found that the total differential scattering cross section is not, as heretofore assumed, a continuous function of the scattering angle, and singularities are observed when the measured cross sections are compared with the cross sections calculated for a continuously varying interaction potential. In the transition region, the experimental scattering cross sections differ most strongly from the calculated ones, with deviations in the form of maxima. The effect is observed for all the investigated pairs and suggests that the real interaction potential is not a continuous function

Card 2/3

L 9290-00

ACC NR: AP5026412

of the shortest distance, but changes abruptly on going from the excitation of one characteristic line to the excitation of another. It is difficult at present to present an unambiguous interpretation of the observed effects. The explanation offered earlier, based on the assumption that vacancies are produced in the inner shells of the colliding particles and are followed by Auger transitions, in poor agreement with the experimental data, as are other hypotheses. Authors thank M. Ya. Amus'ya for a discussion of the results and A. P. Shergin and Z. Z. Latypov for help with some of the measurements. Orig. art. has: 3 figures. 44,55

 TITLE: Charge exchange of protons in alkaline metal vapor with formation of highly
 excited hydrogen atoms 19.55
 SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu.
 (Fizlozheniye), v. 2, no. 7, 1965, 310-314 21
 TOPIC TAGS: proton, charge exchange, alkali metal, hydrogen, excited state
 ABSTRACT: The charge exchange of 10--180 kev protons in vapor of Li, Na, K, Cs, and
 Mg was investigated with an aim at using this process to obtain highly excited hydro-
 gen atoms. An atomic beam, obtained by charge exchange of the protons in the vapor
 of these metals and purified to eliminate the charged particles, was fed into a re-
 gion with strong electric field, of intensity $E < 160$ kv/cm. The ratio of the current
 of the secondary protons, produced upon ionization of the highly excited atoms in the
 field E , to the total current of the atoms $I(E)$ was measured. This ratio character-
 izes the relative charge-exchange yield of the highly excited atoms. The total cross
 section for proton charge exchange and the ratio of the total number of atoms pro-
 duced by charge exchange to the number of protons in the primary beam were also mea-
 sured in individual experiments. These made it possible in turn to determine the
 cross section for the charge exchange accompanied by production of highly excited

Card 1/2

L 9813-66

atoms. Plots of the cross sections against proton energy are presented both for metallic targets and (for comparison) for He, Ne, Ar, and H₂. The plots show that the cross sections for alkaline metals and for magnesium above 15 kev decrease with increasing energy. A characteristic kink was observed for both cross sections in the region 30--70 kev, beyond which the decrease of the cross sections slows down. The presence of the kink on the curves can be attributed to the fact that at low energies the outer weakly-bound electron of the metal atom takes part in the charge exchange, while at high energies a greater role is played by charge exchange with participation of the electrons from the filled shell, analogous to the outer shell of an inert gas. The latter is confirmed by the similarity of the plots for the alkaline metals and magnesium and the similar plots for inert gases at high energies. The main conclusion of the investigation is that vapors of alkaline and alkali-earth metals are more suitable targets for the production of highly excited atoms of hydrogen at energies below 50 kev, and that molecular hydrogen and inert gases are preferable at higher energies. TITLE: Ionization produced during collisions of alkali metal atoms with gas molecules

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 49, no. 2, 1965, 379-385

TOPIC TAGS: collision, collision cross section, gas ionization, alkali metal, atom

ABSTRACT: The results are presented of extensive investigations of ionizing collisions between Li, Na, K, and Cs fast atoms and He, Ne, Ar, Kr, and Xe atoms and H₂ and N₂ molecules. The study was performed in the 3-30 kev energy range. The average results of independent measurements are presented in a table which gives the cross sections of free electron production and of ionization and stripping cross sections. When possible, the data obtained were compared with those of other authors. A comparison of ionization cross sections of gases with stripping cross sections of alkali metal atoms showed in many cases the prevalence of ionization events. It is stressed, however, that in the interactions of alkali metal molecules with the molecules of H₂ and N₂, the stripping cross sections prevailed over the ionization cross sections of the molecules in the whole range of energies. This

Card 1/2

L 01217-66

3
difference was most marked in Li-H₂ and Na-H₂ collisions, i.e., in the collisions of the lightest particles. As a rule, the ionization cross sections showed a continuous increase with the increasing velocity of the colliding particles. At a given velocity, the cross sections increased with the increasing atomic numbers of the particles. Here, however, an exception was observed for pairs with close values of their atomic numbers (e.g., Li-He, Na-Ne, K-Ar, Cs-Xe). The authors feel that their work may be useful in the corpuscular diagnosis of plasmas, and in the study of ionic engines, astrophysics, and mass-spectrometry. Orig. art. has: 3 figures, 1 table, and 3 formulas. [ZL]

TITLE: Ionization and scattering with characteristic energy losses in atomic collisions

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 1, 1966, 123-131

TOPIC TAGS: ionization, inelastic scattering, excitation energy, particle collision, ion energy, argon, neon, krypton,

ABSTRACT: The characteristic inelastic energy losses (energies carried off by electrons and radiation), previously investigated in Ar^+-Ar collisions by the present authors (Compt. Rend. de la VI-e Conf. Int. Phen. d'Ionisation dans les Gaz, eds. SERMA, 1, 111, Paris, 1963; ZhTF 34, 1613, 1964; ZhTF, 34, 1624, 1964; ZhTF, 34, 1637, 1964) and confirmed by E. Everhart et al (Phys. Rev. Lett., 14, 247, 1965; Phys. Rev. Lett., 14, 484, 1965), have been further investigated in Ne^+-Ne , Ar^+-Ar , Kr^+-Kr , and Ne^+-Ar collisions at incident ion energies of 12, 25, and 50 keV, using the apparatus and techniques described in the earlier papers. Characteristic inelastic energy loss "lines" were observed in all the investigated systems. The probabilities for "excitation" of the different "lines" (occurrence of the different characteristic energy

Card 1/2

UNC: 533.2

L 21710-66

ACC NR: AP6004887

3

losses) were nearly independent of the incident ion energy but depended strongly on the distance of closest approach; the positions of the lines, however, did depend somewhat on the incident ion energy. The curves representing the composition with respect to charge of the scattered particles as a function of scattering angle revealed regions of slow and rapid change associated with excitation of the different characteristic lines, and the differential cross section deviated from a smooth curve at scattering angles associated with excitation of the characteristic lines. There was no simple relation between the characteristic lines excited in Ne^+-Ar collisions and those excited in Ne^+-Ne and Ar^+-Ar collisions; from this it is concluded that the lines are not to be ascribed to excitation of any energy levels characteristic of the isolated atoms. Difficulties are pointed out that are encountered in attempts, including the attempt of U. Fano and W. Lichten (Phys. Rev. Lett., 14, 627, 1965), to account for the experimental results by invoking Auger transitions. The authors argue in favor of their earlier hypothesis involving excitation of collective vibrations of the electron shells. The authors thank M. Ya. Amus'ya for valuable discussions, and A. P. Shergin and Z. Z. Latypov for participating in the work. Orig. art. has: 7 figures.

TITLE: Electron attachment to protons in alkali metal vapors with the formation of highly excited hydrogen atoms 27 18

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 7, 1241-1250 1966

TOPIC TAGS: proton, charge exchange, gas target, atom, excited state, alkali metal, inert gas, hydrogen, carbon dioxide, plasma injection,

ABSTRACT: The authors have measured the cross sections of Li, Na, K, Cs, Hg, Ne, Ar, and H₂ for the electron attachment reaction of 10 to 180 keV protons with particular attention to the cross sections for production of highly excited hydrogen atoms. The measurements were undertaken because of their interest in connection with injection of plasma into magnetic traps. The beam, initially of protons, successively traversed the 12 cm long heated target chamber, a weak transverse electric field which removed the charged particles, a strong (up to 160 kV/cm) electric field which ionized the highly excited atoms, and a magnetic field which separated the ions from the remaining neutral atoms. The neutral atoms were recorded with a secondary emission detector

Card 1/2

UDC: 539.186

which was calibrated against a calorimeter. The alkali metals were introduced directly into the target chamber, and the pressure of the vapor target was determined from the temperature of the chamber. Thin target data were obtained for all the target materials. APPROVED FOR RELEASE: 03/20/2001 CIA-RDP86-00513R000412610014-2"
some values of the incident proton energy, for K, Cs, and Co. The data were presented graphically and in tabular form; they are discussed at some length and are compared with theoretical calculations and with data of other investigators. It is concluded that at incident proton energies up to 30 keV the alkali metal vapors are efficient targets for producing both highly excited and moderately or unexcited hydrogen atoms, but that at higher proton energies the inert gas and H₂ targets are more effective for producing highly excited atoms. The authors thank Yu.N. Demkov for discussing the results. Orig. art. has: 7 formulas, 7 figures, and 3 tables.

ACCESSION NR: AP4037261

8/0208/64/004/003/0559/0564

AUTHOR: Fedorenko, R. P. (Moscow)

TITLE: Convergence rate of an iteration process

SOURCE: Zhurnal vysshislitel'noy matematiki i matematicheskoy fiziki, v. 4, no. 3, 1964, 559-564

TOPIC TAGS: convergence rate, iteration process, linear elliptic equation, convergence acceleration, difference operator, linear algebraic equation

ABSTRACT: The author studies the equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 1 \quad (1)$$

in the square $0 \leq x \leq \pi$; $0 \leq y \leq \pi$ with zero boundary conditions. He introduces the lattice $x_i = ih$, $y_j = jh$; $i, j = 0, 1, \dots, N$ and defines the difference operators

$$\begin{aligned} (\Delta_1 u)_{i,j} &= u_{i-1,j} - 2u_{i,j} + u_{i+1,j}, \\ (\Delta_2 u)_{i,j} &= u_{i,j-1} - 2u_{i,j} + u_{i,j+1}. \end{aligned} \quad (i, j = 1, 2, \dots, N-1) \quad (2)$$

He passes to a system of linear algebraic equations

Card 1/2

ACCESSION NR: AP4037261

$$\frac{1}{N} (\Delta_1 u)_{i,j} + \frac{1}{N} (\Delta_2 u)_{i,j} = f_{i,j} \quad (3)$$

OR

$$\Delta u = (\Delta_1 + \Delta_2) u = N f, \quad (4)$$

and estimates the quality of an iterative method of solution. He obtains an estimate for the rate of convergence of the iterations under rather special assumptions which were needed to avoid otherwise complicated estimates. Thus, his result is not a complete proof but is a serious reason for using a good iteration method obtained in this fashion. Orig. art. has: 4 formulas.

V. M. Vaganova, G. V. Gerasimov

TITLE: Optimum regime for reactor shutdown

SOURCE: Atomnaya energiya, v. 17, no. 3, 1964, 189-193

TOPIC: Fedorenko optimum control method, reactor optimum control, reactor poisoning, reactor shutdown

A procedure is described for calculating the optimum regime of a reactor shutdown. The method is based on the Fedorenko optimum control method. It is shown that the concentration of fission products in the reactor core is a function of time and that the concentration of fission products is a function of the concentration of fission products in the reactor core.

TITLE: Optimizing the physical characteristics of radiation shielding

SOURCE: Voprosy fiziki zashchity reaktorov (Problems in physics of reactor shielding); sbornik statey, no. 2. Moscow, Atomizdat, 1966, 5-21

TOPIC TAGS: radiation shielding, variational problem, successive approximation, perturbation theory, *REACTOR SHIELDING*

ABSTRACT: The authors consider the problem of selecting the ratio of components in reactor shielding to give minimum weight or overall dimensions for a given reduction in radiation intensity or to achieve a minimum radiation dose for given shielding weight or dimensions. The problem is formulated as a variational problem on the optimum of some quantity when given conditions are imposed on other quantities. The various approaches to solution of the problem given in the literature are briefly reviewed. The physical characteristics of the shielding (neutron and gamma doses, heat release, weight, etc.) are considered within the framework of perturbation theory and the concept of functions of effectiveness of shielding materials is intro-

Card 1/2

L 05053-67

ACC NR: AT6027917

duced, i. e. functions which give information on the changes in various quantities under given conditions which result from some small change in the densities of the materials. The classical methods of variational calculus are used for determining optimum conditions for functionals representing the various physical characteristics of the shielding. The method of successive approximations is used for solving the problem of optimizing the distribution of shielding components in the general case. An example is given illustrating application of the proposed method. Orig. art. has: 9 figures, 31 formulas.

TITLE: A special optimum control problem

SOURCE: Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki, v. 6, no. 3, 1966, 578-581

TOPIC TAGS: control theory, automatic control theory, optimal control

ABSTRACT: A description of a special optimum control problem is presented. This description is based on the formal modification of a scheme proposed by L. S. Pontryagin i dr. (Matematicheskaya teoriya optimal'nykh protsessov. M., Fizmatgiz, 1961). The final form of the derived expression assumes the form

$$\delta P = \frac{\partial \Phi}{\partial \mu} \delta \mu + \int_{t_0}^{t_1} (Z_i \delta u) dt, \quad Z(t) = M^*(t) \psi(t) + \beta Z_i(t),$$

where

$$\beta = \int_{t_0}^{t_1} (\psi, Qx^{(0)}) dt.$$

Title : Condensation of dihaloidacenaphthenequinones with o-diamines. Part 1.

Periodical : Ukr. khim. zhur. 21/3, 373-376, June 1955

Abstract : Experiments were conducted to determine the condensation reaction of dihaloidacenaphthenequinones and dihaloiddinitroacenaphthenequinones with o-phenylenediamine, 2,3-toluylenediamine, 3,4-toluylenediamine, 5-bromo-2, 3-toluylenediamine and 1,2-naphthylenediamine. It is shown that the condensation reaction is perfectly easy in an acetic acid medium when the solution is heated to a boiling point. The properties of twenty-five new acenaphthylenequinoxalines are listed. Three USSR references (1947-1953). Table.

SOV/119-59-4-14/18

TITLE: An Electric Coal Level Indicator in an Adsorption
Tower (Elektronnyy signalizator urovnya uglya v
kolonne adsorbera)

PERIODICAL: Priborostroyeniye, 1959, Nr 4, pp 28-29 (USSR)

ABSTRACT: Such a device must comply with the following requirements:
1) The resistance R_x of the signal electrodes, at which the
operation of the generator is stopped, must not exceed 100
ohms. 2) The second requirement arises from the stipulations
of safety engineering: The potential between the signal
electrodes must not exceed 1.5 v, and an rms value of
1.07 v for d. c. and a. c., respectively. 3) The device must
provide for stable operation and the connection of leads
with a length of 50 m must be possible (between the signalizer
and the electrodes). In the Laboratory for Automation of the
Kiyevskiy filial instituta Giprotransneft' (Kiyev Branch of
the State Institute for the Design and Planning of Structures,
Transportation and Storage in the Petroleum Industry) a level

Card 1/3

An Electric Coal Level Indicator in an Adsorption
Tower

SOV/119-59-4-14/18

indicator complying with these conditions was developed and tested under laboratory conditions. The circuit of this signalizer consists of 2 oscillators with vacuum tubes of the type 6Zh4, of amplifier cascades with tubes 6N8 and of a supply unit. The device can be tuned by the following methods: 1) shunting of the oscillation circuit with an active resistance ($\sim 20,000$ to $100,000$ ohms). 2) Successive introduction of an active resistance R_d (~ 30 ohms) into the circuit of the feedback coil. 3) Introduction of a ferromagnetic core into the interior of the coil of the high-frequency transformer. It was readily seen from the experiments that the circuit can be tuned most simply by the second method. Automobile spark plugs with somewhat extended electrodes are best suited as signal electrodes. The performance of the oscillators can be controlled by tumblers. In this circuit electromagnetic d. c. relays of the type MKU-48 were used, which are supplied from a 220 v source. It is not advisable to supply this oscillator with a. c. The oscillator was d. c. fed through a germanium

rectifier diode of the type DG-Ts27 and a filter element. This level indicator takes only about 30 w from the power supply. It is suited not only to the control of the coal level in an adsorption tower, but also for the control of other substances with an explosion hazard. Moreover it can be used as an element in circuits of automatic control. There are 2 figures.

TITLE: The interaction of ionic cyclotron waves with high frequency oscillations of a plasma

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 11, 1966, 1964-1970

TOPIC TAGS: nonlinear plasma, turbulent plasma, plasma oscillation, plasma electromagnetic wave, nonlinear effect, plasmon, krypton, air, helium, electron beam

ABSTRACT: The work described in this paper is a continuation of earlier work of the authors (ZhTF, 32, 958, 1962; 34, 458, 1964; 35, 2021, 1965; Yadernyy sintez, 4, 300, 1964) on the nonlinear interaction of waves in plasmas. Plasmas were excited in krypton, air, or helium at pressures of the order of 10^{-4} mm Hg within a 9 cm diameter 100 cm long metal tube in a longitudinal magnetic field of from 0.4 to 1.0 kOe by a 2 cm diameter 50 cm long 200-250 mA beam of 160 eV electrons which was received by a floating collector. Under these conditions oscillations with a frequency of about 12 kHz developed in the plasma. These oscillations were investigated with the aid of adjustable electric probes, a magnetic probe, and an electron beam traversing the chamber parallel to and 2 cm from its axis, and it was concluded that they represent helical ionic cyclotron waves with the propagation vector almost perpendicular to the magnetic field. High frequency power from an external oscillator with a frequency

Card 1/2

ACC NR: AP6036029:

near the electron Langmuir frequency of about 0.5 kHz or near the ion Larmor frequency of about 1.4 kHz was injected at one end of the discharge chamber and the high frequency signal from the plasma was observed with the aid of an electric probe. When the high frequency power was turned on the amplitude of the ionic cyclotron oscillations increased and there appeared oscillations at frequencies equal to the sum and the difference of the frequencies of the high frequency oscillations and the ionic cyclotron oscillations. The low frequency satellite was stronger than the high frequency one. In a brief review of the present and the earlier work it is noted that in all the investigated cases of interaction between low and high frequency oscillations in plasmas there appeared oscillations at the combination frequencies and that, in accord with the concept of plasmon breakup and combination, the low frequency oscillations were strengthened or weakened by the presence of the high frequency oscillations according as the low or high frequency satellite was the stronger. The behavior of the combination frequency oscillations is sensitive to turbulence of the plasma and it is suggested that study of the combination frequency oscillations may prove to be useful in the investigation of plasma turbulence. TITLE:

Device to Control the Tension of Cables (Pribor dlya kontrolya
natyazheniya kanatov)

PERIODICAL:

Priborostroyeniye, 1959, Nr 1, pp 27-28 (USSR)

ABSTRACT:

The Vsesoyuznyy nauchno-issledovatel'skiy institut organizatsii i mekhanizatsii shakhtnogo stroitel'stva (All-Union Scientific Research Institute for the Organization and Mechanization of Mining) developed, constructed and tested the testing device DKK -20. The cable to be controlled runs over 2 fixed rolls and a load roll to receive the tension component of the cable. This load roll runs inside a tube and is connected with a ferromagnetic nucleus which is mobile in two cylindrical coils. A bridge circuit consisting of 2 inductances (the two mentioned coils) and apart from this 2 variable inductances is in equilibrium if there is no tension in the cable. There is therefore no current in the diagonals of the bridge. If there is a tension in the cable the nucleus of the first coil moves into the second. Thus a change of induction in the coils is caused,

SOV/119-59-1-15/20

the bridge loses the state of equilibrium and a microammeter records the difference between the zero position and the new position with the extent of the shift of the nucleus being proportional to the tension in the cable. The scale of the microammeter is calibrated in tons. The device covers two ranges, e.i. from 0-10 and from 0-20 t. It can be used for cable diameters from 19 to 30 mm. By electrical measuring it is possible to measure the tension in the cable also at distant points of the cable. A special device permits an interruption of the movement of the cable at the moment where the desired tension is exceeded. The accuracy of measurement of the device is in the range of 3-5%. There are 4 figures.

TITLE: Production Flow Lines for Bushings and Bracket Insulators
(Potochnyye linii proizvodstva prokhnodnykh i opornykh
izolyatorov)

PERIODICAL: Vestnik Elektropromyshlennosti, 1959, Nr 4, pp 12-16 (USSR)

ABSTRACT: Flow lines for bushing and bracket insulator production have been installed at a number of insulator works but they do not cover the whole process of manufacture and usually terminate at the turning process. The production lines described in this article use belt conveyors along which the various machines and ovens are located; the lines are illustrated in Fig 1. The raw material is delivered on a conveyor, it is then extruded and the parts are cut to length and immediately turned on lathes. They are then conveyed to the drying ovens. The dried insulators are inspected for cracks and moisture content. The glazing procedures are somewhat different for insulators and bushings but both operations are served by the conveyor belt. A photograph of the production lines is given in Fig 2 and the bushing glazing section is shown in Fig 3.
